

## **Arboretum Wespelaar**

### **Winterschade winter 2008 – 2009**

**Koen Camelbeke**

De winter 2008-2009 was een echte, koude winter. Tijd dus voor een evaluatie van de winterhardheid van de planten in onze collectie. En hoewel dit verre van een compleet overzicht betreft, willen we toch iets verder zien dan “*the usual suspects*” zoals *Ceanothus*, *Cistus*, *Drimys*, *Escallonia*, *Magnolia delavayi* en *M. rostrata*, verschillende *Camellia*, enzovoort.

Om aan te tonen dat het toch wel degelijk een koude winter was, hieronder enkele van mijn aantekeningen over het weer uit die periode:

- 5 januari 2009: we gaan een zeer koude week tegemoet met verschillende ijsslagen waarbij de temperatuur, ook overdag, niet boven het vriespunt raakt; 7 cm sneeuw. In de *Magnoliaweide* (de koudste plaats in het Arboretum), maar ook in een “frost pocket” in Herkenrode, meet ik -10 °C op 1 meter hoogte. De sneeuw bedekt de laagste takken van veel planten die op deze manier toch van enige bescherming tegen de vrieskou genieten;
- 6 januari: koudste nacht sinds 1997 en komende nacht wordt nog kouder!
- 8 januari: dit is een echte winter die blijft duren. Deze nacht een absoluut minimum van -19 °C(!) gemeten;
- 14 januari: werken aan het toekomstige bezoekerscentrum, de Rode Poort, eindelijk terug gestart, dooi sinds de 12e maar enkele nachten voordien toch -17 °C gemeten!
- 26 januari: koude week met negatieve temperaturen tijdens de nacht (-3 °C) en koud overdag;
- 29 januari: tweede koudegolf (-7,5 °C); koudste januari in 12 jaar maar zonnig en normale neerslag;
- 6 februari: eerste lentegevoel, maar wordt terug koud komend weekend (-7° C) en week met temperaturen rond het vriespunt ’s nachts. De winter gaat verder;
- 18 februari: tweede keer een lentegevoel, maar winter gaat verder. Terug nachtvorst (opnieuw -7 °C gemeten op koudste plaats);
- 25 februari: de winter gaat verder; niet te koud nu maar geen lente in aantocht; somberste februari sinds metingen, andere waarden normaal;
- 9 maart: dunne laag sneeuw die snel zal smelten, d.i. de maartse bui van deze nacht; lichte vorst gehad ergens voorbij de dagen (-3 °C).

*Buddleja davidii* is een exoot met invasieve neigingen. Deze soort staat op de zogenaamde “watch list” (zie <http://ias.biodiversity.be/>) omdat zij toch een impact heeft op het lokale milieu en zeer wijd verspreid is in België. Toch passen de meeste andere *Buddleja* soorten zich eerder moeilyk aan aan onze klimatologische omstandigheden. We hebben deze winter dan ook veel *Buddleja*'s verloren.

Deze winter hebben we verschillende jonge planten van de genera *Liquidambar* en *Fraxinus* verloren. Ik kan bijna niet geloven dat dit met de vorst te maken heeft (m.u.v. *F. paxiana* en misschien *F. sieboldiana*). Maar ik zie niet direct een andere verklaring (tenzij ik de houtboorder over het hoofd gezien zou hebben). Deelt iemand dezelfde ervaring?

#### TABEL EVALUATIE WINTERHARDHEID

In onderstaande tabel vindt u een overzicht van specimens waarbij een code voor winterhardheid is opgenomen tijdens de winter van 2008-2009. Hoewel het een uitgebreide tabel betreft, betekent dit niet dat specimens die niet in deze tabel voorkomen perfect winterhard zijn.

De tabel bevat volgende kolommen:

##### HARDINESS (H)

Volgende codes voor winterhardheid worden in de databank van Arboretum Wespelaar gebruikt:

- geen code: niet geëvalueerd
- A : winterhard (“hardy”)
- A+ : winterhard (“hardy”)
- A- : bloemknoppen bevroren (“flowerbuds frozen”)
- B : bladschade (“leaf damage”)
- B+ : lichte bladschade (“minor leaf damage”)
- B- : zware bladschade tot volledig bladverlies (“major leaf damage or defoliation”)
- C : takschade (“branch damage”)
- C+ : lichte takschade (“minor branch damage”)
- C- : zware takschade (“heavy branch damage”)
- D : tot de grond ingevroren, komt terug (“cut to the ground, recovering since”)
- E : dood (“killed by cold, not hardy”)

## **Notices dendrologiques**

---

### **NUMBER (N)**

Accessienummer van de plant. De eerste twee cijfers verwijzen naar het jaartal waarop de plant in de databank werd geregistreerd. Dit is een belangrijk gegeven aangezien de leeftijd zeker medebepalend is in de winterhardheid van een individu.

### **STATUS (S)**

Gezondheidstoestand van de plant tijdens inventarisatie. Volgende codes worden gebruikt:

- 4 : gezond
- 3 : minder sterk of gezond, niet goed aangepast, afsterven van delen
- 2 : fysische schade door storm, ziektes, vorst, enz.
- 1 : zeer zwak tot stervend
- 0 : dood

### **NAME × QUANT**

Wetenschappelijke naam en aantal specimens indien meer dan 1. Dit kan worden gevuld door een teken waarbij \*\* staat voor uitzonderlijke plant, een echte aanrader; \* voor aanrader en ° voor ontgoochelend in ons klimaat.

### **SOURCE (O)**

Oorsprong van het plantenmateriaal. WLD = wilde origine, PDS = stekken of zaailingen door Ph. de Spoelberch of andere medewerkers van Arboretum Wespelaar. Voor een overzicht van de betekenis van de andere codes verwijss ik naar [www.arboretumwespelaar.be](http://www.arboretumwespelaar.be).

### **VERIFIED (V)**

Volgende codes voor identificaties worden gebruikt:

- T/V : geverifieerd
- C : leunt dicht aan bij het typische taxon (kleine afwijkingen)
- H : hybride
- K : hybride met gekende ouders
- ? : verder te identificeren
- X : fout, te determineren en aanpassen in databank

### **TOTAL DATA**

Naar aanleiding van dit artikel worden in deze kolom enkel gegevens met betrekking tot winterhardheid opgenomen (in het Engels).
